

# ORGANIC CHEMISTRY

# ORGANIC CHEMISTRY

-Organic molecules contain only **C**, **H**, **O**, **N** and sometimes **S** and **P**

-56 204 570 organic substances have been recorded

Estradiol

Mestranol (Norlutin)

Testosterone

Cocaine

Lysergic acid diethylamide (LSD)

Tetrahydrocannabinol

Theobromine

Caffeine

Aspartame (NutraSweet)

Azidothymidine (AZT)

Penicillin G

Fluoxetine hydrochloride (Prozac)

Acetylsalicylic acid (aspirin)

Naproxen sodium (Aleve)

# ORGANIC CHEMISTRY

## What allows for the diversity of organic compounds?

- Carbon can make 4 bonds
- The 4 bonds can be a combination of **single**, **double**, and **triple** bonds

methane,  $\text{CH}_4$

methanal,  $\text{CH}_2\text{O}$

ethanenitrile,  $\text{CH}_3\text{CN}$

# ORGANIC CHEMISTRY

## Hydrocarbons:

When an organic molecule is composed only of hydrogen and carbon, it is called a **hydrocarbon**:

**Alkanes:** Hydrocarbons with single bonds

**Alkenes:** Hydrocarbons with double bond(s)

**Alkynes:** Hydrocarbons with triple bond(s)

# ALKANES

# ALKANES

- Characterized by C-C single bonds
- Also known as *saturated hydrocarbons*
- empirical formula =  $C_nH_{2n+2}$

$$\begin{aligned} &\rightarrow C_nH_{2n+2}, n=8 \\ &= \mathbf{C_8H_{18}} \end{aligned}$$

# ALKANES

## Properties:

- Hydrophobic (does not mix with water and other polar substances)
- Generally low boiling points (due to weak London Dispersion Forces)
- Longer alkane molecules have higher boiling points

		B.Pt.(C)
methane	$\text{CH}_4(\text{g})$	-164
ethane	$\text{C}_2\text{H}_6(\text{g})$	-88
propane	$\text{C}_3\text{H}_8(\text{g})$	-42
butane	$\text{C}_4\text{H}_{10}(\text{g})$	0
pentane	$\text{C}_5\text{H}_{12}(\text{l})$	+36
hexane	$\text{C}_6\text{H}_{14}(\text{l})$	+68
heptane	$\text{C}_7\text{H}_{16}(\text{l})$	+98
octane	$\text{C}_8\text{H}_{18}(\text{l})$	+126

# ALKANES

**Some IUPAC\* names of alkanes:**

ethane

propane

butane

All alkanes have the suffix "ane"

\*International Union of Pure and Applied Chemistry

# ALKANES

## IUPAC naming system:

Each alkane also has a prefix based on the number of carbon atoms:

meth = 1

eth = 2

prop = 3

but = 4

pent = 5

hex = 6

hept = 7

oct = 8

non = 9

dec = 10

undec = 11

dodec = 12

# ALKANES

## IUPAC naming system:

Molecular formula	Condensed Structural Formula	Name
CH <sub>4</sub>	CH <sub>4</sub>	<b>meth</b> ane
C <sub>2</sub> H <sub>6</sub>	CH <sub>3</sub> CH <sub>3</sub>	<b>eth</b> ane
C <sub>3</sub> H <sub>8</sub>	CH <sub>3</sub> CH <sub>2</sub> CH <sub>3</sub>	<b>prop</b> ane
C <sub>4</sub> H <sub>10</sub>	CH <sub>3</sub> CH <sub>2</sub> CH <sub>2</sub> CH <sub>3</sub>	<b>but</b> ane
C <sub>5</sub> H <sub>12</sub>	CH <sub>3</sub> CH <sub>2</sub> CH <sub>2</sub> CH <sub>2</sub> CH <sub>3</sub>	<b>pent</b> ane
C <sub>6</sub> H <sub>14</sub>	CH <sub>3</sub> CH <sub>2</sub> CH <sub>2</sub> CH <sub>2</sub> CH <sub>2</sub> CH <sub>3</sub>	<b>hex</b> ane
C <sub>7</sub> H <sub>16</sub>	CH <sub>3</sub> CH <sub>2</sub> CH <sub>2</sub> CH <sub>2</sub> CH <sub>2</sub> CH <sub>2</sub> CH <sub>3</sub>	<b>hept</b> ane
C <sub>8</sub> H <sub>18</sub>	CH <sub>3</sub> CH <sub>2</sub> CH <sub>2</sub> CH <sub>2</sub> CH <sub>2</sub> CH <sub>2</sub> CH <sub>2</sub> CH <sub>3</sub>	<b>oct</b> ane
C <sub>9</sub> H <sub>20</sub>	CH <sub>3</sub> CH <sub>2</sub> CH <sub>2</sub> CH <sub>2</sub> CH <sub>2</sub> CH <sub>2</sub> CH <sub>2</sub> CH <sub>2</sub> CH <sub>3</sub>	<b>non</b> ane
C <sub>10</sub> H <sub>22</sub>	CH <sub>3</sub> CH <sub>2</sub> CH <sub>2</sub> CH <sub>2</sub> CH <sub>2</sub> CH <sub>2</sub> CH <sub>2</sub> CH <sub>2</sub> CH <sub>2</sub> CH <sub>3</sub>	<b>dec</b> ane

# ALKANES

**IUPAC naming system:**

Ex: meth**ane**

# ALKANES

## IUPAC naming system:

Name the following alkanes:

hexane

nonane

# ALKANES

## IUPAC naming system:

Not all alkanes are straight chains. Some alkanes have alkyl side groups (*alkyl substituents*) attached.

-CH<sub>3</sub>      **methyl**

-C<sub>2</sub>H<sub>5</sub>      **ethyl**

-C<sub>3</sub>H<sub>7</sub>      **propyl**

-C<sub>4</sub>H<sub>9</sub>      **butyl**

-C<sub>5</sub>H<sub>11</sub>      **pentyl**

-C<sub>6</sub>H<sub>13</sub>      **hexyl**

-C<sub>7</sub>H<sub>15</sub>      **heptyl**

-C<sub>8</sub>H<sub>17</sub>      **octyl**

Ex:

name: **2-methylhexane**

# ALKANES

## IUPAC naming system:

For alkanes with side groups...

locant	Substituent(s)	prefix	suffix
--------	----------------	--------	--------

Ex: 2-methylhexane

# ALKANES

## IUPAC naming system:

Name the following branched alkanes

2-methylpentane

3-methylpentane

*The substituent group is usually given the lowest locant possible*

# ALKANES

## IUPAC naming system:

Which name is incorrect?

2-methylpentane

4-methylpentane

*The substituent group is usually given the lowest locant possible*

# ALKANES

## IUPAC naming system:

Name the following branched alkanes

2,3-dimethylhexane

3-ethylpentane

# ALKANES

## IUPAC naming system:

Name the following branched alkane

1. Find the longest continuous chain of C atoms (parent chain)

2. Identify any substituents

2,4 -dimethylpentane

# ALKANES

## IUPAC naming system:

Name the following branched alkane

4,5,5-triethyl-3,6,6-trimethylnonane

# ALKANES

## Drawing alkanes:

3 types of diagrams

Structural diagram

Condensed diagram

Line diagram

# ALKANES

## Drawing alkanes:

Line diagrams:

Every end or point on a line diagram represents a carbon atom. Hydrogen atoms are not shown.

# ALKANES

## Drawing alkanes:

Draw the following alkanes using line diagrams

methylbutane

3-ethyl-3,4-dimethylheptane

# ALKANES

**When two possible names exist:**

3-ethyl-5-methylheptane or ~~5-ethyl-3-methylheptane?~~

*The ethyl has priority (and gets the lower number) because it comes before methyl in the alphabet.*

# ALKANES

**Homework:**

**Page 14 #1, 2**

**Page 17 #1, 2, 4-7**

# CYCLOALKANES

# CYCLOALKANES

-Ring-like structures of alkanes

-empirical formula =  $C_nH_{2n}$

→  $C_nH_{2n}$ ,  $n=6$

**=  $C_6H_{12}$**

# CYCLOALKANES

## IUPAC naming system:

Name the following alkanes:

cyclobutane

cyclooctane

cyclopentane

*The prefix "**cyclo**" is added to the alkane name*

# CYCLOALKANES

## IUPAC naming system:

Name the following alkanes:

methylcyclohexane

4-ethyl-1,1,2-trimethylcyclohexane

propylcyclobutane

# CYCLOALKANES

## IUPAC naming system:

Draw the following alkanes using line structures:

1,1-dipropylcyclopropane

1-ethyl-1,2,5-trimethylcyclopentane

# CYCLOALKANES

## IUPAC naming system:

Which name is correct?

1-ethyl-1,2,5-trimethylcyclopentane

vs.

2-ethyl-1,2,3-trimethylcyclopentane

*When two different substituents (ex. ethyl and methyl) can be assigned the same number, then the group that comes first in the alphabet gets the lowest number.*

# CYCLOALKANES

## Properties:

Cycloalkanes have higher boiling points than their straight-chain (alkane) counterparts

Physical Properties of Alkanes and Cycloalkanes

Compounds	Bp, °C	Mp, °C	Density, $d_4^{20}$ , g ml <sup>-1</sup>
propane	-42	-187	0.580 <sup>a</sup>
cyclopropane	-33	-127	0.689 <sup>a</sup>
butane	-0.5	-135	0.579 <sup>b</sup>
cyclobutane	13	-90	0.689 <sup>b</sup>
pentane	36	-130	0.626
cyclopentane	49	-94	0.746
hexane	69	-95	0.659
cyclohexane	81	7	0.778
heptane	98	-91	0.684
cycloheptane	119	-8	0.810
octane	126	-57	0.703
cyclooctane	151	15	0.830
nonane	151	-54	0.718
cyclononane	178	11	0.845

*Notice cycloalkanes have higher densities, meaning their molecules have less space between one another*

Cycloalkane molecules *stack closer together* due to their ring conformations forming "stackable" shapes. The closer distance allows stronger London dispersion forces.

# CYCLOALKANES

## “Boat” vs “chair” conformations of cyclohexane

### **Chair** conformation of cyclohexane

chair conformation

viewed along the “seat” bonds

© 2015 Pearson Education, Inc.

Newman projection (*side view*)

### **Boat** conformation of cyclohexane

# CYCLOALKANES

## "Boat" vs "chair" conformations

CHAIR/CHAIR INTERCONVERSIONS OR "RING FLIP"  
IN CYCLOHEXANE

(same as above, but C-H bonds not shown)

### MECHANISM OF INTERCONVERSION

(pucker up/right)

# CYCLOALKANES

## “Envelope” vs “half-chair” conformations of cyclopentane

*The planar conformation has **too much torsional strain**. The envelope and half-chair conformations relieve the strain.*

# HALOALKANES

# HALOALKANES

- Alkanes with halogen atoms
- Also known as *alkyl halides*

# HALOALKANES

## IUPAC naming system:

Halogen groups:	<b>-F</b>	fluoro
	<b>-Cl</b>	chloro
	<b>-Br</b>	bromo
	<b>-I</b>	iodo

*Just like alkyl substituents, the halogens are placed at the beginning of the name, and are ordered **alphabetically**.*

2-Chloro-2-methylpropane

2-Chloro-2,3-dimethylpentane

1-Chloro-2,2-dimethylpropane

# HALOALKANES

## IUPAC naming system:

Name the following haloalkanes:

1,2-dibromo-1-chlorobutane

2-bromo-2-methylpropane

2-bromo-2-chloro-1,1,1-trifluoroethane
